

ABSTRACT

The disclosure is a system for providing additional application software to an existing data center without the need for additional databases being added. The additional application software is added by connecting the main database and any existing auxiliary databases of an initial application with an interface module. The additional application software is also connected with the interface module that translates data formats from the additional application software and the main and auxiliary databases of the initial application. Use of the interface module allows the additional application software to be added to the application already existing within a data center without additional databases being added.

In one embodiment, the interface module may reside at an ASP site. In another embodiment, the interface module may reside within the added application software. In another embodiment, the interface module may reside within the data center that houses the initial application.
